Probe assembly units are shown in Figures 1a, 2a, 3a, 1b, 2b, 3b, 1c, 2c and 3c, where a probe 1 comprises an electrically conductive elongate body with a first end 2 and a handle assembly 6 which retains a second end 3 and a stimulus delivery portion 4 between the first 2 and second 3 ends. It consists of a multi-processor apparatus capable of simulating 5 artificial neurons that send out signals identified by the central nervous system as "no pain" via the application of surface electrodes on skin in the pain areas.

The length of the probes 1 will vary depending on the area to be treated for example Transcutaneous Electrical Nerve Stimulation TENS is a patient controlled method of treatment that is accepted by the medical community for the stimulation of peripheral inhibitory fibres in patients with nociceptive pain. Advanced Search. Clinical application.

For quadriceps evaluation, the dynamometer was placed on the ipsilateral arm

successful patient will report significant if not total pain relief for a period.
